SMART

Overview

1. Context & Aim
2. Data sources
3. Overall workflow
4. Estimation of immunity pre-2009
5. Results and Discussion

SACEMA's Modelling and Analysis Response Team:

Jeremy Bingham, Lauren Brown, Zinhle Mthombothi, Tumelo Sereo, Cari van Schalkwyk, James Azam (former), Juliet Pulliam

Model structure

$S_{(i)}$ Fully susceptible

$V_{H(i)}$ Humoral immunity only

$G_{(i)}$ Gut (mucosal) and humoral immunity

Age classes are represented by (i)

Aim

- Estimate levels of **gut** and **humoral immunity** to WPV1 at the district level, in five-year age bands
- Provide initial conditions to SACEMA's poliovirus transmission model
- Help motivate for and inform public health interventions such as catchup campaigns

Vaccination for wild poliovirus type 1

Vaccination schedule

Age of child	Vaccine type
At birth	OPV 0
6 weeks	OPV 1 IPV 1
10 weeks	IPV 2
14 weeks	IPV 3
18 months	IPV 4

IPV

Humoral

OPV

Gut (mucosal)

Data Sources

- **NDoH:** IPV1-4 and OPV0-1 doses at district-level 2009 – July 2022; missing some years
- **WCDoH:** birth-dose BCG and IPV1 at facility-level in WC 2009 – July 2022
- **Schoub et al. 1998:** 1995 nationally representative seroprevalence survey of 12 - 35 month old children (province-level)
- **Statistics South Africa:** district-level live births 1998-2020
- **Thembisa model:** population size estimates per province, per age

Overall workflow

Vaccination & population data

District-level
immunity estimates

Bootstrap for missing doses

Data from NDoH was incomplete; e.g.,

- All provinces: no OPV0 data for 2009-2019

Compute ratios of
OPV0 / OPV1 doses administered for
years with complete data

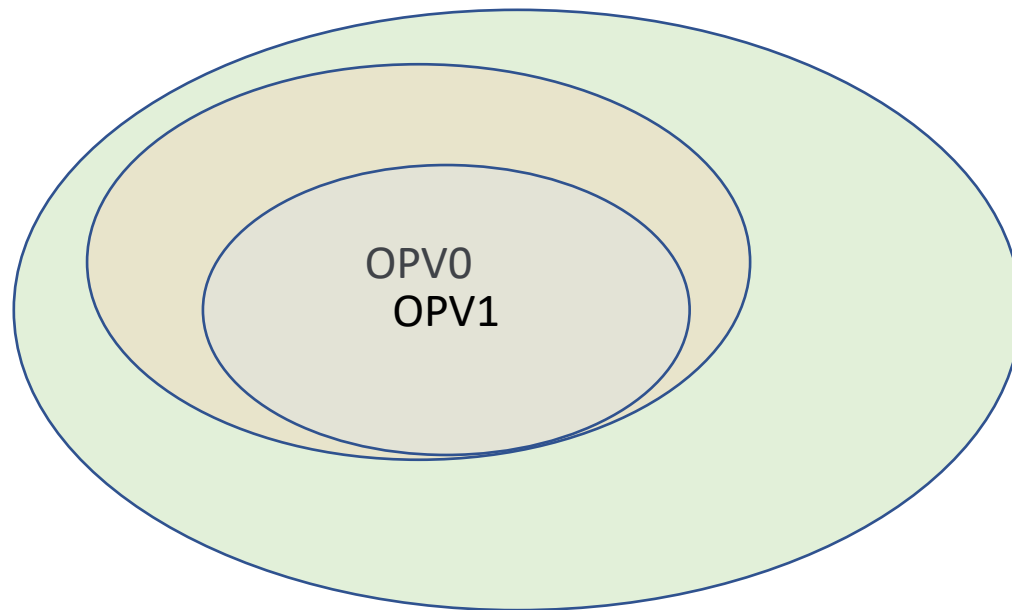

For each missing data,
sample a ratio

Multiply ratio by number of
OPV1 doses to get number of
OPV0 doses

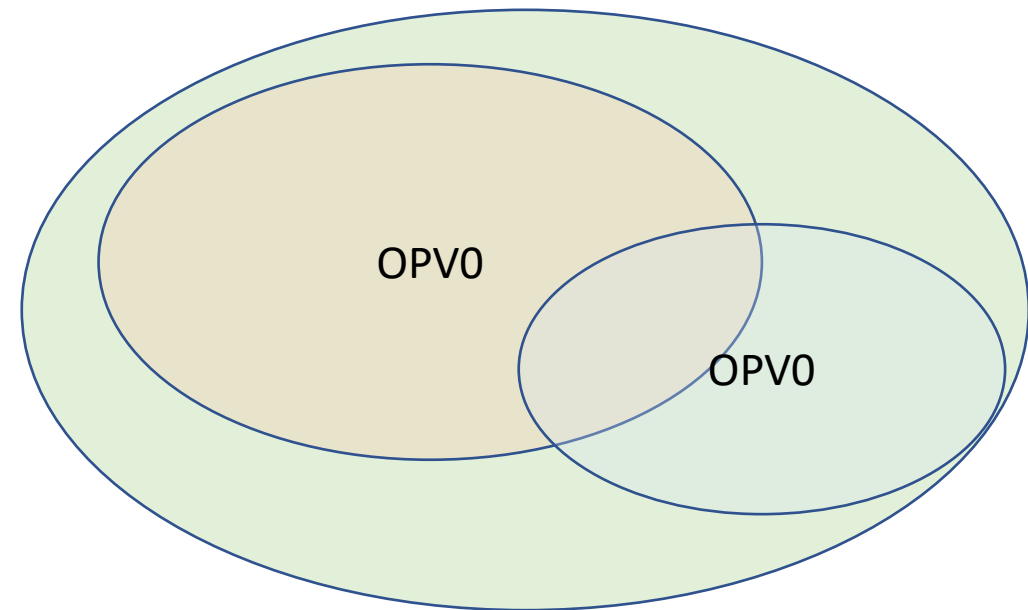

Distribute doses

ORGANIZED

RANDOM

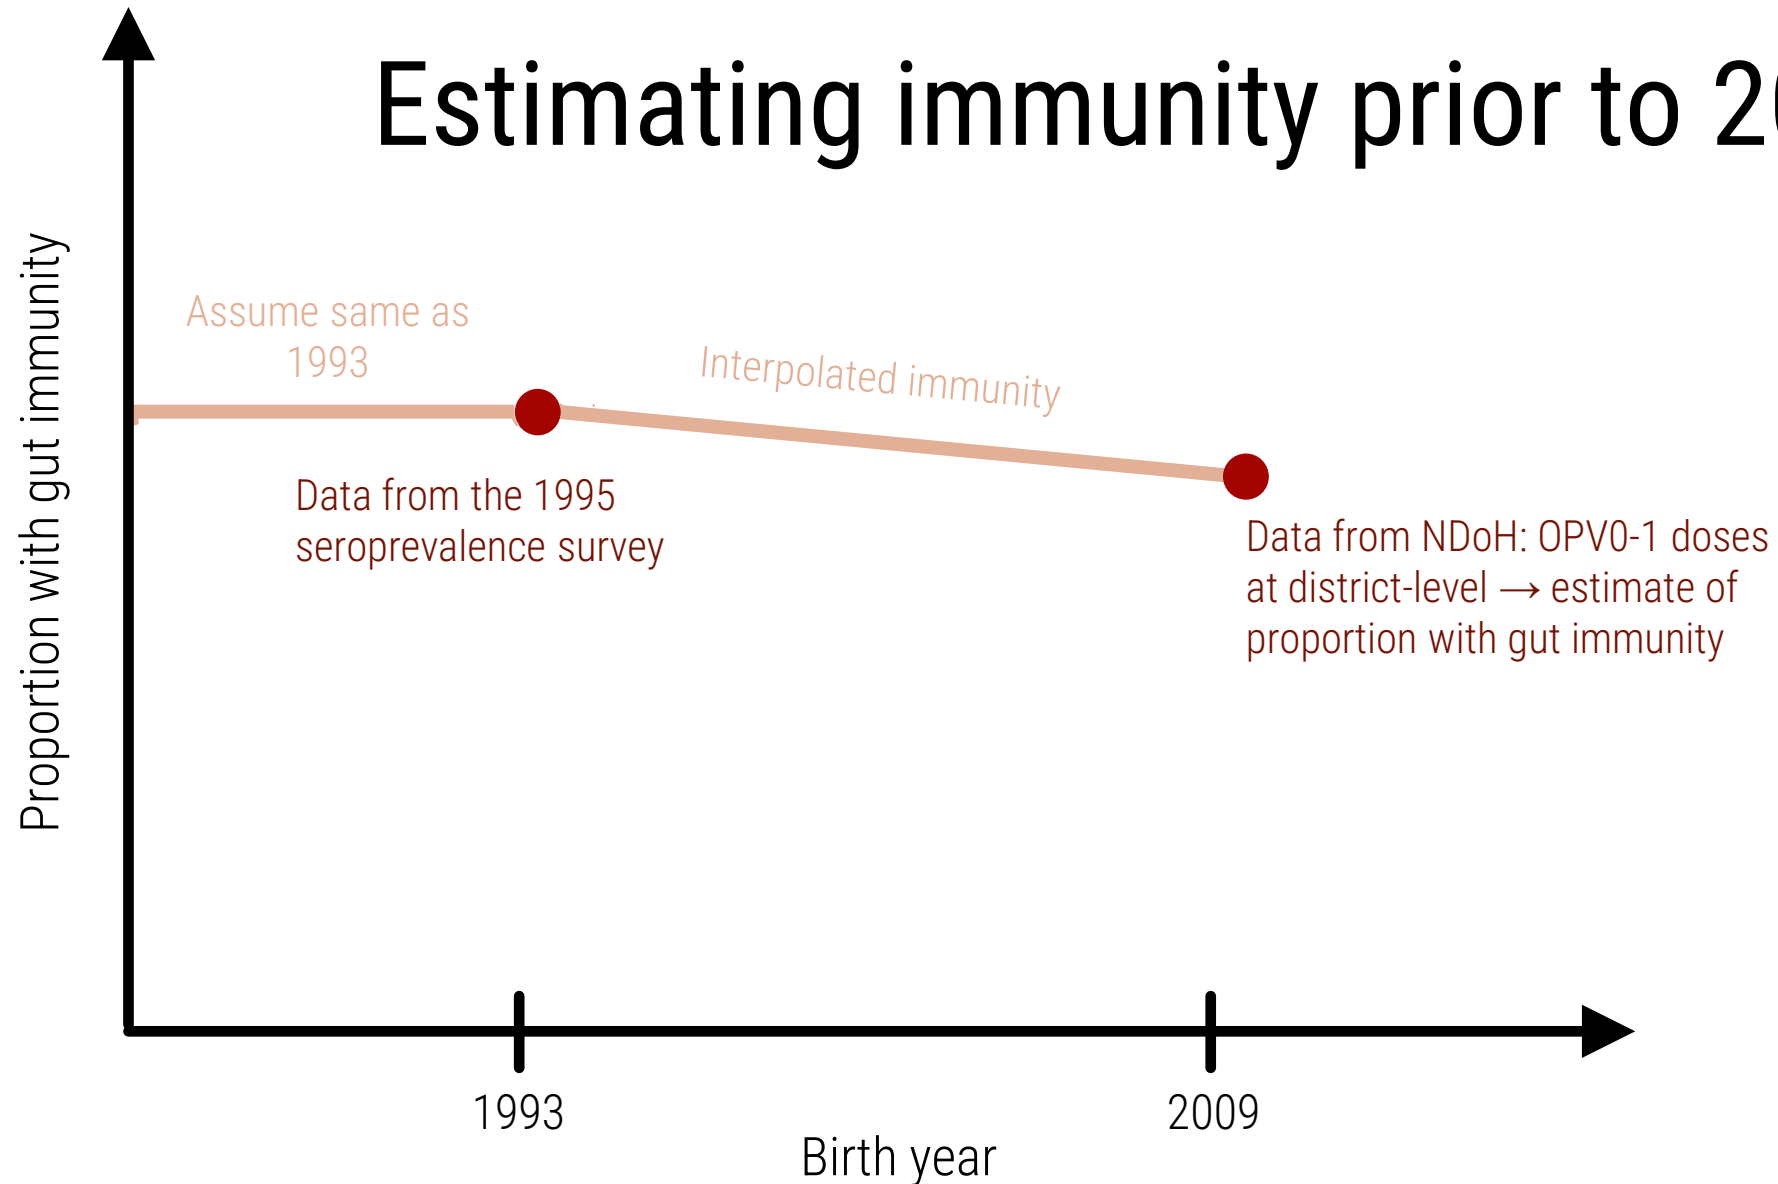

Putting the pieces together

- Assume fixed per-dose efficacy for bOPV and tOPV
- Specify independently 1- 2- 3- and 4-dose efficacy for IPV
- Calculate number of children with gut and humoral immunity per birth year
- Calculate proportion immune per age group (0-4, 5-9, etc.)
- Calculate proportion immune for humoral immunity only:
 - $\text{prop_hum} * (1 - \text{prop_gut})$

Estimating immunity prior to 2009

Results

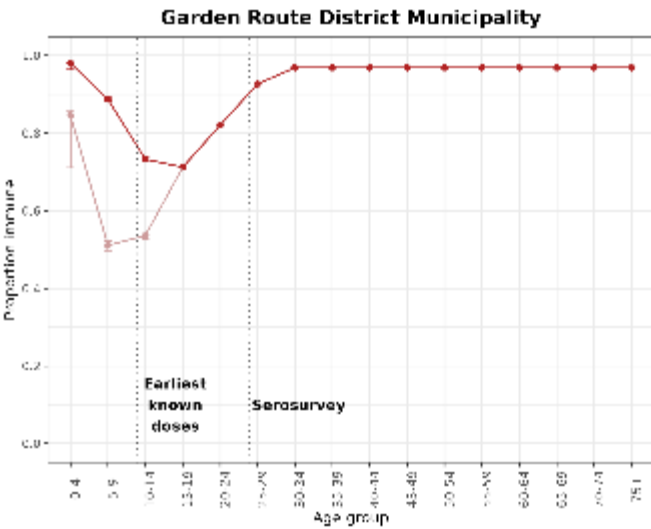

Age-structured immunity estimates

Immunity type

- Mucosal immunity
- Any immunity

Proportion of under-5's with gut or humoral immunity to WPV1

Proportion of under-15's with gut or humoral immunity to WPV1

Discussion

- Concerning risk for widespread AFP
- 10-24 year olds at highest risk
- Younger children mostly protected but gap in gut immunity could amplify an outbreak
- Wider age range should be considered for catchup campaigns

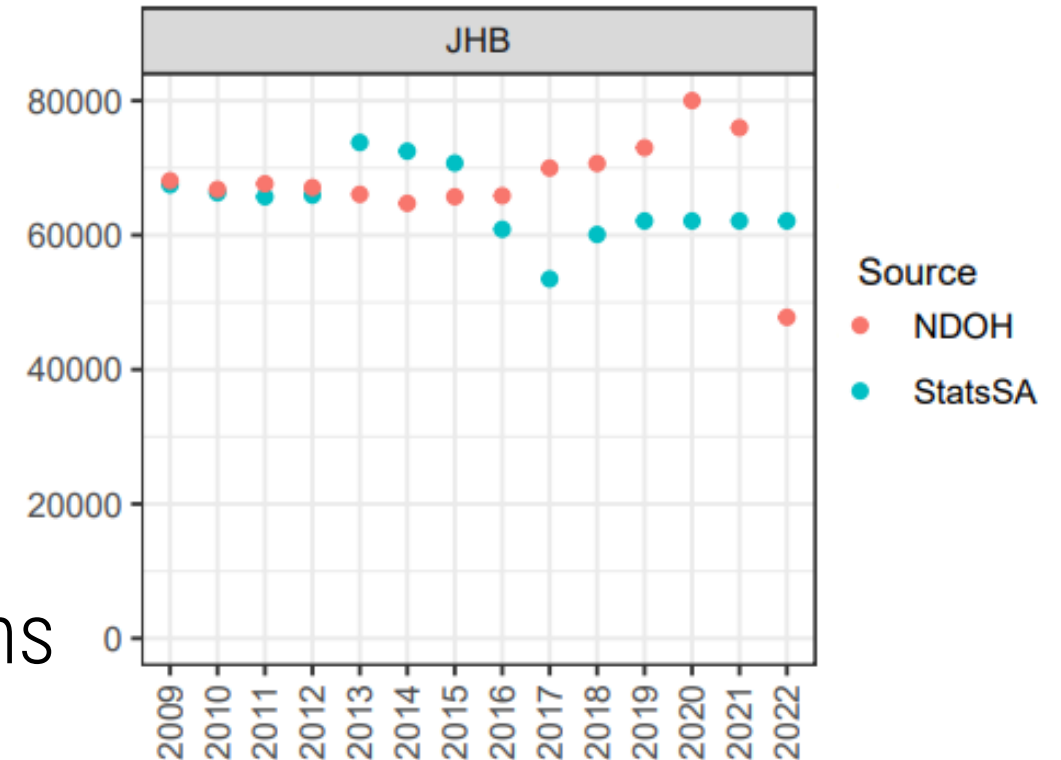

Limitations

- Missing data
 - Routine vaccination pre-2009
 - Catchup campaigns
- Live births
- Efficacy assumptions
- Assume doses administered $<$ live births

Limitations

- Missing data
 - Routine vaccination pre-2009
 - Catchup campaigns
- **Live births**
- Efficacy assumptions
- Assume doses administered < live births

Limitations

- Missing data
 - Routine vaccination pre-2009
 - Catchup campaigns
- Live births
- Efficacy assumptions
- Assume doses administered $<$ live births

Next steps

- Incorporating data on catchup campaigns
- Improving live births estimates
- Validation on intermediate results
 - Zero-dose babies
 - WHO/UNICEF estimates of national immunization coverage
- cVDPV2

Estimating immunity given dose distribution

- Assume fixed per-dose efficacy for bOPV and tOPV
- Specify independently 1- 2- 3- and 4-dose efficacy for IPV
- Compute number immune based on annual doses given
- Divide by annual live births to get proportion immune
- Use province-level population size estimates to combine birth years into age groups
